

The use of MC4 connectors is crucial when wiring solar panels in a series or parallel arrangement. The solar panels can easily be attached to these connectors" positive and negative terminals. Each solar panel"s voltage is combined when wiring solar panels in series.

With series wiring, the voltage of the panels adds together while the amperage (current) stays the same. Example: If you have four 100W solar panels wired in series and each panel outputs 5A at 20V, your array would output 5A at 80V (4 panels x 20V = 80V). That 80V output is in full sun.

Many styles of solar panels for roof applications will have a hinge that allows the panel to swing up so that you can access the roof, frame, and the backside of the solar panel. That is an advantage over a clamp system. See also: Wiring Solar Panels (Connection Types + Methods) Step 4.5 How to install solar panels and inverter
