350kW high-powered charger. Tritium's 350kW high-powered chargers are the heavy lifters in the global EV charging environment. Whether you manage a network of highway rest stops where EV drivers seek a fast charge, or you operate a fleet of heavy-duty mining vehicles, the PK350 is up to the challenge.

**Key Features of Charging Piles:** **Power Output:** Charging piles typically offer a power output ranging from 3 kW to 22 kW depending on their specifications and intended usage. **Connectivity Options:** These units often come equipped with multiple connectivity options such as Type 1 or Type 2 connectors to cater to different types of electric vehicles.

according to the actual electricity price of charging pile, namely the industrial TOU price; (2) Charging service fee: 0.4-0.6 yuan per KWH, and 0.45 yuan is temporarily considered. Considering the annual charging and running time of the 16 newly added charging piles of 2500 h (7 h per day on average), the annual power consumption is about 2

Solar energy or photovoltaic (PV) power is produced by capturing the sun's energy and turning it into electricity. The sun releases packets of energy known as photons. When these photons hit a solar panel (also known as a module), which is made up of multiple solar cells, they knock electrons loose from their atoms.

**Power Delivery:** The charging pile supplies electric energy to the vehicle's battery. In AC charging, the charging pile converts the AC power from the grid into DC power suitable for the vehicle's battery. In DC fast charging, the charging pile directly provides high-voltage DC power to the vehicle's battery.

If a charger station has a local isolated power transformer, non-isolated converter topologies can be used. Fig. 3 is a non-isolated topology, which has been by EU 350kW ultra-fast charging station design. Each charger pile (point) consists of 6 60kW fully SiC-based power converter modules. Fig. 1.
