The MnO_2 cathode has a property that significantly contributes to tantalum capacitor reliability. Defects in the Ta_2O_5 dielectric cause local heating at the defect site during capacitor operation, which changes the nearby MnO_2 to Mn_2O_3 -- a non-conductive phase of manganese oxide. This non-conductive site serves to remove that portion of the capacitor from the circuit, ...

The suggested test is similar to the surge current testing that is currently used for MnO_2 tantalum capacitors but assures dissipation of high power in the part during the whole period of testing. Using various types of capacitors, the reproducibility of test results for different lots of PTCs and from sample to sample in a lot were estimated.

A mica capacitor is a type of capacitor that uses mica as the dielectric material. These capacitors are known for their high stability, high quality factor, and high temperature tolerance. Mica capacitors are commonly employed in high-frequency applications and radio frequency circuits where precise capacitance values are crucial.

Weibull grading test is a powerful technique that allows selection and reliability rating of solid tantalum capacitors for military and space applications. However, inaccuracies in the existing method and non-adequate acceleration factors can result in significant, up to three orders of magnitude, errors in the calculated failure rate of capacitors.

Exposure of chip MnO₂ tantalum capacitors to humid environments might result in increased ESR, leakage currents, and first turn-on failures. However, there is a lack of literature data on the effect of moisture on reverse bias behavior of the parts. The presence of moisture can also result in pop-corning when a high water vapor pressure develops when moisture absorbed ...
