State of charge (SoC) represents the available battery capacity and is one of the most important states that need to be monitored to optimize the performance and extend the lifetime of batteries.

4 cell chosen in Section 5. Other chemistries are briefly mentioned, however, as the techniques proposed here are general. 2 Battery Review Batteries consist of series and parallel electrical combinations of individual cells such as the one shown in Fig. 1. These cells develop an electric potential through a series of electrochemical reactions.

During lifetime the cells of battery packs are exposed to different load and environmental conditions that affect the ageing processes [11]. Additionally, cell production quality, as well as material variations, lead to different ageing processes and thus behaviour of each single cell [12, 13] spite being important and of great interest, the effect and impact of these ...

As briefly discussed earlier, there are cells inside each battery that form the voltage level, and that battery rated voltage is the nominal voltage at which the battery is supposed to operate. The capacity refers to the amount of charge that the battery can deliver at the rated voltage, which is directly proportional to the amount

The following is a list of parameters that may be specified by a manufacturer for a given type of battery. For example, in a typical battery for a general car, the energy density is not relevant - a battery is a small fraction of the total battery weight and consequently this parameter would typically not be listed for a conventional car battery.

Batteries are perhaps the most prevalent and oldest forms of energy storage technology in human history. 4 Nonetheless, it was not until 1749 that the term "battery" was coined by Benjamin Franklin to describe several capacitors (known as Leyden jars, after the town in which it was discovered), connected in series. The term "battery" was presumably chosen ...
