mismatch that has a short life. In a well-matched battery pack all cells have similar capacities.

Taking a look at the arrangement of the batteries, the laptop battery has 6 cells in a series/parallel arrangement, so 3 cells in series to generate the 11.1 volts, and 2 cells in parallel to double the capacity to 4800 mAh. The camera battery has 2 cells in series, so the capacity is the same, but the voltage is doubled.
