In this role, it has been used as a carrier transport material. Finally, it has also been used to protect the unstable perovskite films, because graphene has better physical, chemical, and thermal stability. Some elements, like lithium and nickel, can be used to make many types of batteries. Others like, vanadium and cadmium, are, as of today, only used in one type of battery each.

Lithium-ion batteries (LIBs) have been widely used in electric vehicles, portable devices, grid energy storage, etc., especially during the past decades because of their high specific energy densities and stable cycling performance (1-8). Since the commercialization of LIBs in 1991 by Sony Inc., the energy density of LIBs has been aggressively increased.

Power packs last longer and create a stronger electric current than a single battery. They're available at hardware stores and battery shops, and can be used just like a normal battery. Do a little research before picking out a larger battery pack to be sure you're picking one that's safe and will work.
