As the battery ages, the car will use the ICE more. At some point in the battery failure, there may not be enough battery to run the car. (The car is started using the traction battery and reverse is handled only by the electric motor (but reverse can be helped by some generation). However, that may not happen for a long time.

It's not surprising. You see, this isn't something new really. The spread that is. The proper way to jump-start on a traditional ICE vehicle is to put positive on battery of dead car, positive then negative on jumping car, then finally the negative on the dead car, but NOT on the negative terminal of the battery! You are supposed to put it on bare, ...

For my cooler, it would have been more to the point to have a standard 12v outlet, but the Sienna only has one up front in the dash under the bridge, and it is already in use for the dash cam. You can wire in a fairly heavy duty inverter (even more than 1500 watts) to the 12v system much easier, just don't try and use the power point under the ...
