TP4056A module is most commonly used with all projects involving a Lithium-ion battery. As we know a lithium battery should not be overcharged or over discharged, hence this module will monitor the voltage level of the battery during charging and discharging. If the values go beyond critical value the module will automatically disconnect the circuit and protect your battery.

A battery module like this will be very useful when powering our electronic projects with lithium batteries. The module can safely charge a lithium battery and boost its output voltage to a regulated 5V which can be used power most of our development boards like Arduino, NodeMcu, etc.

This is several questions and should probably be broken apart, but nevertheless. According to this TP4056 datasheet, a 1.2 kO R PROG will give a charging current between 950 and 1050 mA. This is a bit much for a lithium-ion battery, which typically prefers a charging current no more than 1 C (e.g. 900 mA for a 900 mAh battery).
