# The prospects of vanadium electrolyte energy storage

The vanadium redox flow battery (VRFB) was invented at University New South Wales (UNSW) in the late 1980s and has recently emerged as an excellent candidate for utility-scale energy storage. Energy is stored in a liquid vanadium electrolyte and pumped through a membrane to generate electricity.

The energy storage proceeds as follows: 1) active species are contained in the tanks as a solution with a certain energy density, 2) the solution, defined as electrolyte, is pumped into the stack, where the electrochemical conversion takes place and collected back in the tanks. The size of the stack defines the power of the system whilst the amount of ...
