6 &#0183; The power conversion efficiency (PCE) of PSCs has shown rapid improvement and a potential for further enhancement. However, compared to other types of solar cells, such as silicon, the stability of perovskite cells under real-life conditions is still insufficient [14]. This lack of stability is a major barrier to the commercialization of PSCs and it is considered the most ...

Variations in temperature were studied to investigate the concentration change of oxygen vacancy in H-TiO<sub>2</sub>. The H-TiO<sub>2</sub> nanocrystals prepared at different temperatures were employed into photoanodes sensitized by N719 dye and ...

The use of non-fullerene acceptors (NFAs) in organic solar cells has led to power conversion efficiencies as high as 18%<sup>1</sup>. However, organic solar cells are still less efficient than inorganic ...

One of the greatest attributes of metal halide perovskite solar cells is their surprisingly low loss in potential between bandgap and open-circuit voltage, despite the fact that they suffer from a non-negligible density of sub gap defect states. Here, we use a combination of transient and steady state photoc

This oxygen-induced degradation pathway has been shown to affect the stability of both CH<sub>3</sub>NH<sub>3</sub>PbI<sub>3</sub> photoactive layers and solar cell devices<sup>40</sup>. Transient absorption spectroscopy studies of ...

In this manuscript, we review the progress and design principles of the molecular compounds for perovskite solar cells. The molecular design strategies that consider the A-site cations, additive molecules, solvent molecules, and surface adsorbates are explained, followed by a discussion on the molecular design at different perovskite-related ...

Herein, we demonstrate that CQDs can be further passivated through two-step annealing; air annealing forms sulfonate bonding at (111) Pb-rich surfaces, and subsequent N<sub>2</sub> ...

Here we show that, even under the combined stresses of light (including ultraviolet light), oxygen and moisture, perovskite solar cells can retain 94% of peak efficiency despite 1,000 hours of ...

Understanding degradation mechanisms in perovskite solar cells is key to their development. Now, Guo et al. show a greater degradation of the perovskite structure and morphology for devices ...

This work highlights crucial aspects to improve the charge generation process of metal-oxide based solar cells and reveals new strategies to improve the power conversion ...

The oxygen impurities in silicon act as interstitial sites, forming donor levels as well as acceptor levels within the bandgap [34]. Donor levels mainly reduce the lifetime of optically generated charge carriers, leading to the recombination losses and consequently deteriorate the performance of the solar cell [34,35].

CdSeTe alloy is a promising material to improve the  $J_{sc}$  of CdTe based thin-film solar cells [[1], [2], [3], [4]]. Meanwhile, Se also plays the role of passivating defects in the CdTe thin film materials [5, 6]. There are three kinds of ways to incorporating Se into CdTe, including diffusion from CdSe/CdTe double layer [3], co-deposition of CdSe and CdTe [7] and ...

In summary, we demonstrated in this work the metal electrode-related degradation of organic solar cells under light illumination and 85% thermal stress. It was found that top Ag electrodes can be degraded even under an inert atmosphere with extremely low (<0.01 ppm) moisture/oxygen.

Radiation is widespread in nature, including ultraviolet radiation from the sun, cosmic radiation and radiation emitted by natural radionuclides. Over the years, the increasing industrialization of human beings has brought about more radiation, such as enhanced UV-B radiation due to ground ozone decay, and the emission and contamination of nuclear waste ...

Those oxygen radicals have been identified as the precursor of chemical reactions in a polymer:NFA solar cell leading to photobleaching and, thus, to  $J_{sc}$  losses [8,14,22,23].

The consistent efforts to find a silicon alternative for solar cells brought about a game changer in 2009 with the perovskite (PVSK) light absorber [1], [2]. With an important milestone in 2012 by introducing the solid-state version of PVSK solar cells, great attention has been focused on PVSK solar cells [3], [4] yielding a certified power conversion efficiency ...

Understanding the fundamental origin of morphological degradation in non-fullerene acceptor-based organic solar cells is challenging. In the April 2021 issue of Nature Materials, Ghasemi et al. reveal that the most thermodynamically unstable and low-miscibility systems with high Flory-Huggins interaction parameter ( $\chi$ ) exhibit the most kinetically stable ...

Here, we demonstrate that light and oxygen-induced degrdn. is the main reason for the low operational stability of methylammonium lead triiodide ( $\text{MeNH}_3\text{PbI}_3$ ) perovskite solar cells exposed to ambient conditions. When exposed to both light and dry air, unencapsulated  $\text{MeNH}_3\text{PbI}_3$  solar cells rapidly degrade on timescales of minutes to a few hours.
