China is currently in the early stage of commercializing energy storage. As of 2017, the cumulative installed capacity of energy storage in China was 28.9 GW [5], accounting for only 1.6% of the total power generating capacity (1777 GW [6]), which is still far below the goal set by the State Grid of China (i.e., 4%-5% by 2020) [7].

Compressed air is defined as air condensed in volume and then kept in a constricted space under pressure. To understand the mechanics of compressing air, imagine a cylinder with a piston pump. If the pump is pulled back, the compression is low because the trapped air molecules can move freely within the pressure vessel.

The special thing about compressed air storage is that the air heats up strongly when being compressed from atmospheric pressure to a storage pressure of approx. 1,015 psia (70 bar). Standard multistage air compressors use inter- ...

Compressed air energy storage (CAES) is a way of capturing energy for use at a later time by means of a compressor. The system uses the energy to be stored to drive the compressor. When the energy is needed, the pressurized air is released. That, in a nutshell, is how CAES works. Of course, in reality it is often more complicated.
