Battery Power Output and Power Density. Battery power output is typically measured in watts (W) and represents the rate at which the battery can deliver electrical energy. Power density, on the other hand, is a measure of the amount of power that a battery can deliver per unit of weight or volume.

The way the power capability is measured is in C"s.A C is the Amp-hour capacity divided by 1 hour. So the C of a 2Ah battery is 2A.The amount of current a battery "likes" to have drawn from it is measured in C.The higher the C the more current you can draw from the battery without exhausting it prematurely. Lead acid batteries can have very high C values ...

Power density, defined as the amount of power (the time rate of energy transfer) per unit volume, is a critical parameter used across a spectrum of scientific and engineering disciplines. This metric, typically denoted in watts per cubic meter (W/m), serves as a fundamental measure for evaluating the efficacy and capability of various devices, systems, and materials based on their spatial energy distribution.

This makes a system with a high power density ideal. Power density is also why it takes time to recharge your flash in between photos. The battery has a lower power density than the capacitor in the flash. This means that the recharge time for the flash is limited by the power output of the battery, rather than the power output of the flash.
