Rising EV battery demand is the greatest contributor to increasing demand for critical metals like lithium. Battery demand for lithium stood at around 140 kt in 2023, 85% of total lithium demand and up more than 30% compared to 2022; for cobalt, demand for batteries was up 15% at 150 kt, 70% of the total.

When it comes to batteries for electromobility, a high energy density is required. " With an anode made of pure metallic lithium instead of graphite, we could store many times more energy in a cell of the same size, " says Kravchyk. However, the lithium is not stripped and deposited evenly when the cell is charged and discharged.
