Instead, the amount of battery that a user is allowed to access is restricted. This reduced capacity is called the "usable capacity," or "available kilowatt-hours (kWh)" and is usually 95%-99% of the total available capacity. For instance, a battery that can physically hold a total of 65 kWh may only make available 62 kWh for the car ...

You can immediately see that the high capacity 200Ah cell produces a minimum pack capacity ~138kWh at ~800V. The increments in pack capacity are also 138kWh. The small 5Ah cell allows a more granular approach to pack sizes, the downside is the number of cells that are used and hence the complexity of items such as the busbars.

This instruction also includes external battery chargers (portable rechargers and power banks) containing a lithium ion battery. For lithium batteries that are installed in a device (laptop, cell phone, camera, etc.), see FAA regulations for "portable electronic devices, containing batteries."
