Voltage. NiMH's are rated at 1.2V initial voltage, which is lower than the 1.5V that alkalines put out at first. This is generally not a problem, but it does mean that flashlights will be dimmer at first, and devices that need 4 or more batteries might burn through the batteries very quickly or not work at all. On the other hand, some devices (like many digital cameras) are designed to work ...

However, some modern technologies are now ...

If you measured the voltage of a 9V battery supply, you would notice that it reads above 9 volts when it's new and has full life. If you used an exact 9-volt rated capacitor, it would be exposed to a higher voltage than the maximum specified voltage (the voltage rating). Usually, in a case such as this, it shouldn't be a problem, but nevertheless, it's a good safety margin and ...

Battery capacity is typically rated in ampere-hours (Ah) or milliampere-hours (mAh). The capacity of a battery is determined by the amount of energy that it can store.
