Capacitor Charge Capacitor Charge Figure 7: In a packaging machine with low capacitance, the bus voltage ramps quite fast and activates the shunt resistor. If we add an additional 5000uF bus capacitor, the capacitor bank will charge during regenerative power surges and then discharge when appropriate. The capacitor bank enables the energy to be

Charge on this equivalent capacitor is the same as the charge on any capacitor in a series combination: That is, all capacitors of a series combination have the same charge. This occurs due to the conservation of charge in the circuit.

Determine whether resistors are in series, parallel, or a combination of both series and parallel. Examine the circuit diagram to make this assessment. Resistors are in series if the same current must pass sequentially through them. Use the appropriate list of major features for series or parallel connections to solve for the unknowns.
