

What to do if the power supply and battery cannot be turned on

The battery is connected to the power supply which outputs 3.3V and powers the ESP32 through its 3.3V pin. I don't have a schematic for this specific devkit I'm using so the devkit used in the schematics is the DOIT one, hence all of the pins are off. The code is quite simple, though, so it hopefully can clear things a bit:

If the input voltage for the power supply unit (PSU) does not match the correct setting for your country, your computer may not power on at all. Remove the main battery in the laptop or tablet and try ...

The battery driver manages the power supply to the system. Besides this, the driver is also responsible for displaying the battery indication icon located on the tray menu. Any issues with it may indicate a problem with the battery driver. To fix this, try updating the driver. Press the Windows + X key and select Device Manager. Expand ...

If your laptop battery doesn't seem to hold a charge, your AC adapter may have been damaged by the surge. Dirty power from power surges or brownouts can also affect your AC adapter, causing it to stop properly charging your battery. Check Your Battery. If you're working with a laptop, take out the battery and try booting it using AC power.

A power supply can hold enough charge to kill someone for a long time - days certainly. That's why you should never disassemble a power supply. I'm a little surprised with your claim, but I guess if the power supply will turn on without mains attached, and given the low power requirements of a lot of modern hardware, I believe it. -

Remove any residual electricity by removing the battery, disconnecting the power adapter, and pressing and holding the power button for 30 seconds nnect the power adapter again, wait 30 seconds, and then turn on the system. If your laptop starts, turn it off again and reinstall the battery.

If the battery icon doesn't have a charging, or lightning, symbol over the battery on the taskbar, even when the power supply is connected and the power connector light is on, ...

Related read: Battery shows being charged but battery percentage not increasing. 3] Battery calibration. If you do not systematically charge the battery, the irregular battery drainage and ...

Replace your power supply immediately if it fails any test you perform. After replacing the power supply, assuming you do, keep your PC plugged in for 5-10 minutes before turning it on. This delay provides time for some recharging of the CMOS battery, which may have been drained.

Next, Checkup > Battery Health. Click on the small arrow icon. Now turn the Battery Charge Limit off. Do a Battery Reset. Performing a battery reset has resulted in fixing many charging-related issues. When doing a

What to do if the power supply and battery cannot be turned on

reset, the battery gets to reconnect to the laptop which decreases the chances of any errors, and connection issues disappearing.
