Energy storage is expected to play an increasingly important role in the evolution of the power grid particularly to accommodate increasing penetration of intermittent renewable energy resources and to improve electrical power system (EPS) performance. Coordinated, consistent, interconnection standards, communication standards, and

Although using energy storage is never 100% efficient--some energy is always lost in converting energy and retrieving it--storage allows the flexible use of energy at different times from when it was generated. So, storage can increase system efficiency and resilience, and it can improve power quality by matching supply and demand.

Communication with a battery energy storage system or BESS that is compliant with this protocol is not yet state-of-the-art but will be necessary in the future [15], [16], [17]. The steady growth of (private) photovoltaic (PV) systems in recent years makes the idea of a BESS interesting since PV systems" production of electricity is highly volatile [18], [19].

Energy storage is now thriving in the market. Energy storage systems can range from quick response choices for network management in near real-time and on a daily basis to longer-term options for unpredictable week-to-week fluctuations and more anticipated seasonal variations in supply and demand. Different types of energy storage systems:

There are four sets of standards considered for EVs: (1) plug, (2) communication, (3) charging topology, and (4) safety. All these standards are maintained in the V2G technology.

The Main Types of Electrochemical Energy Storage Systems. There are many different types of battery technologies, based on different chemical elements and reactions. The most common, today, are the lead-acid and the Li-ion, but also Nickel based, Sulfur based, and flow batteries play, or played, a relevant role in this industry.

The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050.
