The lithium-titanate battery is a rechargeable battery that is much faster to charge than other lithium-ion batteries. It differs from other lithium-ion batteries because it uses lithium-titanate on the anode surface rather than carbon. This is advantageous because it does not create a solid electrolyte interface layer, which acts as a barrier ...

Lithium titanate batteries face competition from other lithium battery types, such as lithium iron phosphate (LFP). While LFP batteries have a lower initial cost, lithium titanate batteries provide higher energy and power densities, faster charging speeds, and better performance in extreme temperature conditions.

Lithium titanate (Li<sub>4</sub>Ti<sub>5</sub>O<sub>12</sub>, LTO) anodes are used in lithium-ion batteries (LIB) operating at higher charge-discharge rates. They form a stable solid electrolyte interface (SEI) and do not show any volume change during lithiation. Along with ambient conditions, LTO has also been evaluated as an anode material in LIBs that operate in low (-40-0 °C) [1] or high ...
