Commercially available solar panels now routinely convert 20% of the energy contained in sunlight into electricity, a truly remarkable feat of science and engineering, considering that it is theoretically impossible for silicon-based solar cells to be more than 32% efficient. This upper bound, known as the Shockley-Queisser Limit, was first calculated by the ...

Solar in the larger energy system. Today, solar PV is one of the cheapest sources of new energy being built, second only to wind energy. 5 The International Energy Agency forecasts that solar will be the largest source of energy in the world before the end of this decade, and rates it as the only energy-generating technology whose growth is "on track" to ...

Fluctuating solar and wind power require lots of energy storage, and lithium-ion batteries seem like the obvious choice--but they are far too expensive to play a major role.

One of the biggest benefits of solar energy is that it can help to increase energy independence. By generating electricity from the sun, individuals and communities can become less reliant on traditional energy sources and reduce their dependence on foreign oil. Solar energy can also help to create jobs and stimulate local economies, which can further ...
