It takes energy to pile up free electrons into one end of the battery since electrons want to repel each other. Naturally, you don't want this to happen in a battery that you want to keep running since the repulsion of the electrons would quickly reach equilibrium with the the energy being produced by the battery to move them and bring everything to a standstill.

An EV can be charged from an AC or DC charging system in multi energy systems. The distribution network has both an energy storage system and renewable energy sources (RES) to charge EVs [24], [25].For both systems, AC power from the distribution grid is transferred to DC but for an AC-connected system, the EVs are connected via a 3 f AC bus ...

The reason for why wires heat up when a current flows through them is that a battery converts chemical energy into electric potential energy. This electric potential energy is given to the electrons, and since the electrons try to minimize their electric potential energy, the electrons convert this electric potential energy into kinetic energy.
