# Will the battery degradation of new energy be significant after 8 years

For the Model 3, for instance, Tesla says that up to 30% degradation is normal after 8 years or 120,000 miles driven. Interestingly, many owners who like to keep track of their car's battery ...

¶ If an average EV battery degrades at 1.8% per year, it will still have over 80% state of health after 12 years, generally beyond the usual life of a fleet vehicle. However, as we expect EV battery life to decline non-linearly, there would likely be ...

As the number of charge and discharge cycles increases, the performance and life of the lithium-ion battery gradually deteriorate. 1 There are many different causes for ...

For the Model A battery cell (Figure 9b), the increase in the charging C-rate (from 1 C to 5 C) increases the battery degradation (i.e., capacity fade). On the other hand, for the Model B battery cells, (Figure 9c) the battery degradation is not influenced by the charging C-rate, which may be related to the composition of the cathode.
