Generally, Fuel systems work in the following ways:

- o Fuel is delivered from the fuel tank to the fuel injectors via a fuel pump and fuel lines. The pump is normally positioned close to the fuel tank or within the tank itself.
- o Fuel leaving the fuel tank and fuel pump passes through a fuel filter which purifies and gets rid of any containment.

Fuel oil from the tank is passed through the filter, where the oil gets filtered and the clean oil is injected into the diesel engine through the fuel pump and fuel injector. The mixture of the compressed air and spray of fuel oil is ignited in the engine and the combustion takes place. The released heat energy is utilized for driving the generator, which produces power.
